Final Website Paper

DuronEats

The color and theme will be darker tones being navy blue and black. I want this page to contrast the pictures with bright colors with the simple colors. I want the overall theme to be clean and neat while being able to show the items well.

I made the structure with the intention of the main page to link to all the others and vice versa. The main reason for this was because many use this site to check the quality of the person being me. This is to make it easy for new people to look around. I want the site to be easy going and very user friendly with not having too much in the way. I think this was the best way to go about it since this shows the photos and makes it easy to look for info.

Yes, I used multiple logos and pictures. The logos for the social media inputs as well as photos for the menu items. This makes it so the guests can easily identify where they can get more info. This also includes the pictures for the food menu items. This is great to have photos so the guests can actively investigate and relate. This also gives a strong impression for guests to see if the quality is to their liking. This also makes it so for intentional purpose the site can be updated as new photos and events emerge to make it more community driven.

Overall, the site matches well since it doubles as a portfolio as well as my intro to my private business. As for desired audience, it works simply and is quick for accessing info. This does wonder since my audience would be for people on the go or quick references. This also has

the added benefit of having various pages to show photos and menus. This makes it so they rarely must leave the site to any other app. In terms of technical abilities, the site accomplishes everything it needs to pass and shows information. The site also is simple for navigating around for many users who may not have tech experience. As for reasoning for visiting site would mainly be for private catering work, or if people are looking for references. This can help them get to know me or my work. This also gives them security for knowing me or seeing how I perform.

- About: the three most were main, img, and footer. Main with class container to separate the value. Img file was to put the photo of me for the showing about us page. As for the footer is to put copyright and the duroneats rights at the bottom
- Menu: Main, img, and footer, with strong ascent for some p. The main section to put the menu paragraphs with a strong format. This is to help bold. The img file is to put in the pictures for the food and to show the style. The footer is once again to make the copyright to make the pages like consistent.
- Media: Div social, img, href. The div social is to make the files for the social media links and this is to make sure I can adjust the shape and size. Img is for making the logos and adjusting the styles of the logos themselves. Href is for then files to link the sites as well as the pages to the specific logos.
- Contact:href, main, and footer. Href is to help link the email and phone number to the sites. This way is to contact and connect with the webmaster. Main is to connect and to adjust the class as container. This is to help adjust all the text in mass to center and make it look well. Footer is to make sure all ends stay identical to make them consistent.

- Index: the fire span, style, src, href, img, and audio. The fire symbol I wanted to add some more flares to the title page. The style is to help center the header to make sure the page aligns. The src is to make a path to the music and for the audio file to ensure the file type. Img is to make sure to add the pictures for the logos for the links to connect with the pages. Audio is to make sure the tage is to make a loop and autoplay function for the music file added.
